## Problem

Cannot create a chart in a sheet populated by exported data from a different sheet.

## Solution

### 1. Create a simple table with column titles to export your data

	A	B	C	D	E	F	G	H	I	J	K	L	M	N
1	Key	Estimated	Spent											
2		&(for issues)												
3	\$(Key)	%{\$OriginalEstimate}	%{\$TimeSpent}/3600											
4		&{end}												
5														
6														
7														
8														
9														
10														
11														
12														
13														
14														
15														
16														
17														
18														
19														
20														
21														
22														
23														
24														
25														
26														
27														
28														
29														
30														

### 2. Create a named formula for each column in your table. This formula will have the following syntax:

```
=OFFSET(DATA!$A$1,1,0,COUNTA(DATA!$A:$A)-1,1)
```

This formula will create a zone/range that will represent the column with all the exported data.

- \* DATA!\$A\$1 -> This represents the starting cell: we'll start on the column title (Sheet 'DATA', Cell A1: 'Key', in this example)
- \* 1 -> The vertical offset of the zone/range based on the starting cell (start one cell below that one)
- \* 0 -> The horizontal offset of the zone/range based on starting cell (we want to stay in the same column)
- \* COUNTA(DATA!\$A:\$A)-1 -> This will count all cells with values on sheet 'DATA' and Column A (subtract one to remove the 'Key' title), defining the zone/range with all the rows exported
- \* 1 -> Number of columns to define the zone/range (we only want the column we're on)

### 3. Create a chart on a different sheet and "Select Data"

\* Add a new Series for each column you want to visualize in your chart:

\*\* Series name: ="Estimated"

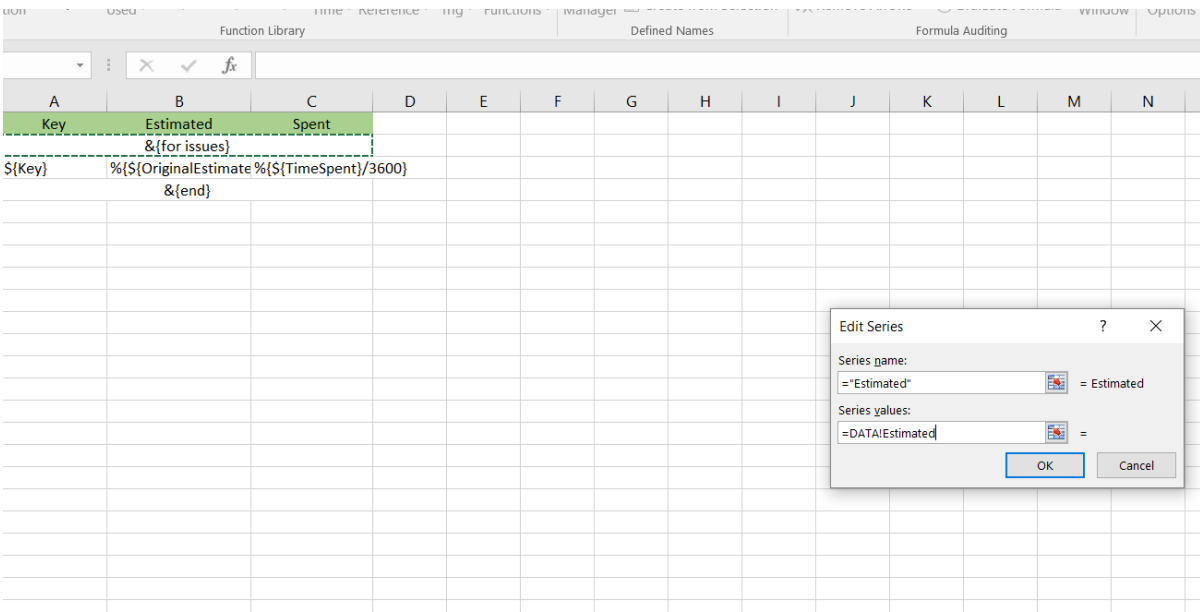

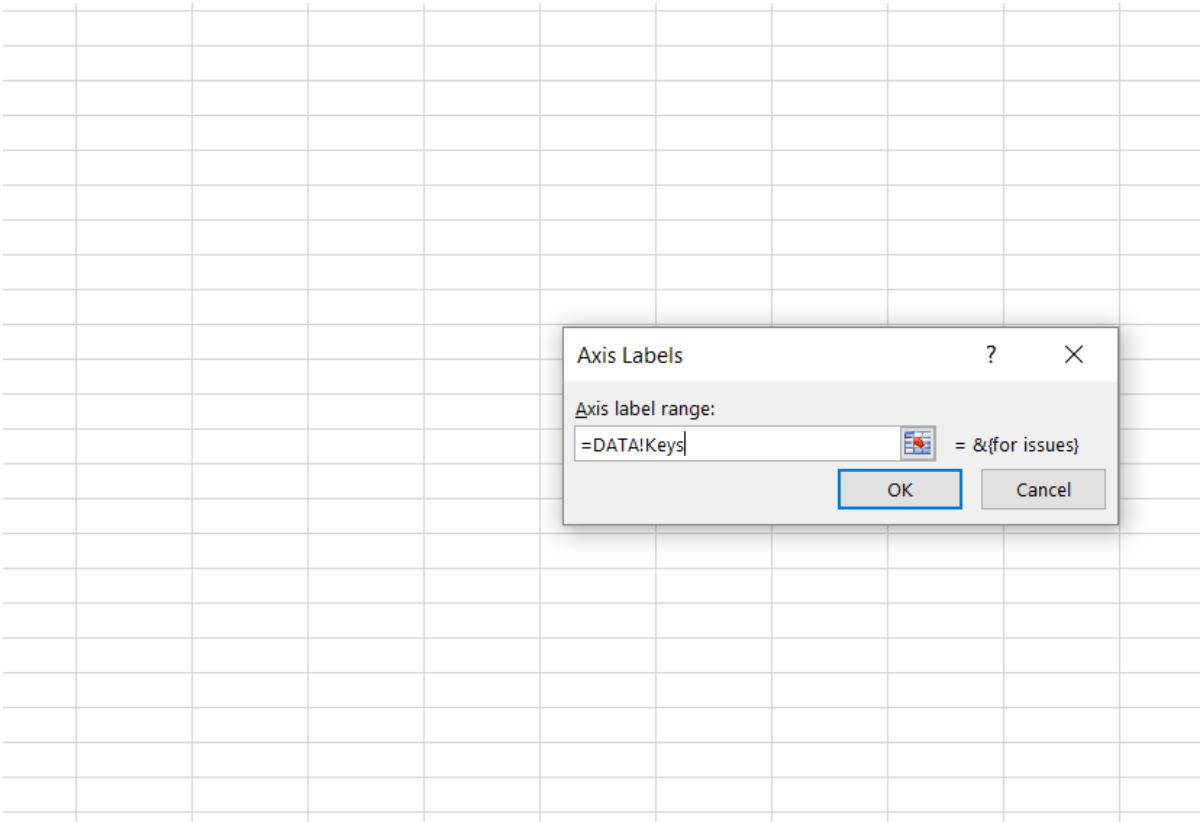

\*\* Series values: =DATA!Estimated (sheet with data exported + name defined of the named formula)

\*\* Series name: ="Spent"

\*\* Series values: =DATA!Spent

\* Add a Horizontal (Category)

\*\* =DATA!Keys

4. Save, upload to Xporter for Jira, and then export issues with data.
